Hello,

The following submission has been created.

Track Name: ICACECS2026

Paper ID: 853

Paper Title: Enhancing Farmer Productivity Through Innovative Technology Solutions

Abstract:

Agriculture is still an important sector for food security and economic growth, however, has been faced with challenges that have included inefficient use of resources, soil degradation and lack of access to timely agricultural information. Recent advances in digital technologies create opportunities to deal with these challenges by implementing data driven decision support systems. We introduce here a new technology-based system created to increase farmer productivity by combining soil sensor analysis, artificial intelligence-supported decision logic, and agricultural advisory services. The system has been mainly designed for paddy f

ield crops, and it continuously checks soil parameters (moisture content, pH value nutrient status) to know the crop-soil compatibility in order to make decisions on irrigation and fertilization; recommendations are given in real time. The platform also integrates market information and government agricultural programs to facilitate informed agronomic and economic decisions. The platform is developed based on web technology and a relational database system that could be easily accessible and scalable for the SG. Experimental analysis on some sample soil datasets reveals the efficacy of the proposed approach in a) increasing decision accuracy, b) improving resource utilization c) promoting crop productivity and sustainability in agriculture.
